1. Whats App
 - a. The gateway has the whats app socket and the reconnect loop
 - b. There is a watchdog that tracks message activity
 - c. Baileys is the gateway that sends a message when there is an inbound message
2. Gateway (Openclaw)
 - a. After receiving the message the gateway
3. Agent loop
 - a.
 - b. Takes the information from the detected chat and sends it to the

1. Whatsapp receives a message from the use
2. Baileys takes the message and sends a notification notifying that there is a message
3. The agent loop takes the notification and resolves a new session for that conversation if its new or if existing resolves the session
 - a. This is where Session Management takes place
 - b. The thing passed from the baileys provides the information from the chat
 - c. Basically takes the info and determined if there is an existing session
4. The agent gets initialized in the agent runtime where its skills, memory, and persona is uploaded
5. During the session with the agent the agent will create a markdown with the information from the session
